*NAS RK is pleased to announce that News of NAS RK. Series of chemistry and technologies scientific journal has been accepted for indexing in the Emerging Sources Citation Index, a new edition of Web of Science. Content in this index is under consideration by Clarivate Analytics to be accepted in the Science Citation Index Expanded, the Social Sciences Citation Index, and the Arts & Humanities Citation Index. The quality and depth of content Web of Science offers to researchers, authors, publishers, and institutions sets it apart from other research databases. The inclusion of News of NAS RK. Series of chemistry and technologies in the Emerging Sources Citation Index demonstrates our dedication to providing the most relevant and influential content of chemical sciences to our community.*

Қазақстан Республикасы Ұлттық ғылым академиясы "ҚР ҰҒА Хабарлары. Химия және технология сериясы" ғылыми журналының Web of Science-тің жаңаланған нұсқасы Emerging Sources Citation Index-те индекстелуге қабылданғанын хабарлайды. Бұл индекстелу барысында Clarivate Analytics компаниясы журналды одан әрі the Science Citation Index Expanded, the Social Sciences Citation Index және the Arts & Humanities Citation Index-ке қабылдау мәселесін қарастыруды. Web of Science зерттеушілер, авторлар, баспашилар мен мекемелерге контент тереңдігі мен сапасын ұсынады. ҚР ҰҒА Хабарлары. Химия және технология сериясы Emerging Sources Citation Index-ке енүі біздің қоғамдастық үшін ең өзекті және беделді химиялық ғылымдар бойынша контентке адалдығымызды білдіреді.

НАН РК сообщает, что научный журнал «Известия НАН РК. Серия химии и технологий» был принят для индексирования в Emerging Sources Citation Index, обновленной версии Web of Science. Содержание в этом индексировании находится в стадии рассмотрения компанией Clarivate Analytics для дальнейшего принятия журнала в the Science Citation Index Expanded, the Social Sciences Citation Index и the Arts & Humanities Citation Index. Web of Science предлагает качество и глубину контента для исследователей, авторов, издателей и учреждений. Включение Известия НАН РК в Emerging Sources Citation Index демонстрирует нашу приверженность к наиболее актуальному и влиятельному контенту по химическим наукам для нашего сообщества.

**TESTING OF MO-CONTAINING CATALYSTS APPLIED  
TO AL-, AL/ZR-PILLARED CLAYS DURING THE OXIDATIVE  
DEHYDROGENATION OF ETHANE TO ETHYLENE**

**Abstract.** The development of an alternative method for the oxidative dehydrogenation of ethane to ethylene is an important task in the presence of a suitable catalyst. Mo-containing catalyst systems applied to Al-, Al/Zr-columnar clays were prepared. The textural characteristics of the synthesized Al-, Al/Zr-columnar clays differ from the textural properties of natural clay with an increase in their specific surface from ~54 m<sup>2</sup>/g to ~215 m<sup>2</sup>/g. The LaNbMo and VMoTeNb catalyst systems applied to 1-, Al/Zr-columnar clays showed higher activity and selectivity for oxidative dehydrogenation of ethane (ODH). A detailed characterization was achieved using XRD, adsorption of N<sub>2</sub>, SEM, BET to study the texture properties of the synthesized catalysts. The highest activity and ethylene selectivity were shown by 10% VMoTeNb/PILCs and 20% VMoTeNb/PILCs catalysts. The lowest ethylene selectivity was exhibited by 10% LaNbMo/PILCs and 20% LaNbMo/PILCs catalysts. The results obtained indicate that the application of LaNbMo and VMoTeNb polyoxide active phases to Al-, Zr-columnar clays can improve the physical and mechanical properties of these types of catalysts due to changes in both the nature of the crystalline phase and the catalytic properties in oxidation reactions.

**Keywords:** oxidative dehydrogenation; ethane ethylene; mechanism ethylene production.

### 1. Introduction

In recent years natural gas reserves and their rational use have been of great interest. Partly, natural gas can be attributed to renewable natural resources, since methane emission begins immediately with rotting biomass of animal and vegetable origin, and they renew faster than oil.

Currently, natural gas is widely used in the power industry and much less in the chemical industry due to some inertness of the gas. That is, many chemical reactions that have an industrial sense require too high costs to be economically viable [1, 2]. For example, the process of dehydration of light alkanes also presents a significant problem associated with their low reactivity, high energy consumption, and low selectivity [3-5].

One of the ways to intensify the dehydrogenation of alkanes is their oxidative dehydrogenation (ODE). In the case of oxidative dehydrogenation of ethane (ODE), these reactions are as follows:

Despite the widespread use of steam cracking, fluid catalytic cracking, and catalytic dehydrogenation in the synthesis of olefins, intensive research is underway to develop oxidative dehydrogenation (ODH) catalysts for alkanes. This approach can significantly reduce the temperature of this process, which leads to higher selectivity and less coking of the catalysts [1, 3]. A number of catalysts have been proposed to improve ethane conversion and ethylene selectivity [6-10].

Ethane ODE is performed on a solid catalyst in which ethane reacts with an oxidizing agent, usually oxygen. When comparing the ODH of ethane with existing commercial processes, a number of advantages are noted: there is no thermodynamic limitation ( $\Delta G^\circ = -128 \text{ kJ/mol}$ ); the reaction is exothermic ( $\Delta H^\circ = -106 \text{ kJ/mol}$ ), which eliminates the need for energy; a limited number of reaction products (CO<sub>x</sub> and ethylene) is observed; catalyst deactivation with coke does not occur due to the presence of oxygen in the reaction medium [8]. Therefore, the development of an alternative method for the oxidative dehydrogenation of ethane to ethylene in the presence of a suitable catalyst has become an urgent task.

Based on this, the goal of this study is to develop new catalytic systems applied to columnar clays in order to obtain an environmentally friendly and economically viable catalyst, designed to increase ethane conversion and ethylene selectivity.

## 2. Experimental part

### 2.1 Catalytic synthesis

Research objects are polyoxide catalyst systems deposited on columnar clays capable of catalyzing the process of oxidative dehydrogenation of ethane to ethylene.

#### 2.1.1 Mechanical activation of natural clays

To activate natural kaolinite clays, the AGO-2 high-voltage planetary mill was used. The grinding was carried out with steel balls with a diameter of 8 mm and a total weight of 200 g in 150 ml water-cooled steel drums. The ratio of balls' mass to the mass of mixture (M) was 20:30. The rotational speed of the drums was 1200 rpm (40g). To ensure a low level of powder contamination in the steel grinding medium, the natural lining of the working surface of drums and balls, obtained by preliminary activation of a similar mixture, leading to the coating of the surface of the balls and the inner surface of the drums with the processed composition, was used [11].

#### 2.1.2 Synthesis of columnar clays

Pre-cleaned and ground natural clays with particle diameters up to 0.25 mm were incubated for 24 hours at room temperature for complete hydration., Aluminum and zirconium hydroxocomplexes were used as intercalating solutions (hydrolysis of aqueous solutions of aluminum chloride (0.2 M) and zirconium chloride (0.2 M) in aqueous NaOH solution (0.5 M)). Pillarization was carried out by slowly adding intercalating agent to clay samples, followed by washing of chlorine ions. The obtained Al-, Zr-columnar clays were dried for one day at room temperature, then they were calcined at 500 °C for 5 hours.

#### 2.1.3 Preparation of catalysts

Mixed oxides LaNbMo and MoVTeNb with nominal atomic ratios La:Nb:Mo=1:0.8:0.2 and V:Mo:Te:Nb=0.3:1:0.23:0.12 were prepared. The synthesis of the catalysts included the following stages: 1) an aqueous solution containing ammonium paramolybdate (Merck, 99%), telluric acid (Sigma-Aldrich, 98%) and ammonium metavanadate (Sigma-Aldrich, 99.5%), was prepared with constant stirring at 80 °C FROM; separately 2) an aqueous solution of niobium oxalate (ABCR Laboratories, 99%) was also prepared at 80 °C. 3) then, a solution of niobium oxalate was added to a mixture containing ammonium paramolybdate, telluric acid and ammonium metavanadate with vigorous continuous stirring. The resulting mixture turned into a suspension, which was cooled to room temperature. Using the impregnation method, the prepared polyoxide system was applied onto the surface of Al-, Al/Zr-columnar clays by the volume of moisture capacity. Then, the catalyst samples were dried at 50 °C for gradual evaporation of water. The catalysts were first thermally treated at 310 °C for 1 h, then they were calcined at 700 °C for 3 h in a stream of nitrogen.

## 2.2 Characterization of catalysts

### 2.2.1 Study of physico-chemical properties of the catalysts

The texture characteristics of columnar clays were studied using nitrogen adsorption and desorption isotherms using the BET method (Brauner-Emmett-Teller) on a SORBTOMETR-M device (Russia). The

change in the phase composition of the catalysts was monitored using x-ray phase analysis on a general-purpose diffractometer DRON-4.0.7 with CuK $\alpha$  radiation (Russia).

### 2.2.2 Statistical processing of data

Statistical analysis was performed with a help of SPSS Statistical Program (version 16, Chicago, Illinois, USA) using semi-logarithmic regression analysis Graphpad PRISM Software (San Diego, California, USA).

## 2.3 Catalytic test

### 2.3.1 Reactor plant with on-line chromatographic analysis

Catalytic experiments were carried out in an automated laboratory flow reactor with on-line chromatographic analysis of the components of the reaction mixture. A quartz tube reactor with an internal diameter of 10 mm and 200 mm in length was equipped with two thermocouples, one of which showed the temperature of the wall of the reactor, and the other measured the temperature of the catalyst layer. All runs were performed by feeding a mixture, consisting of ethane (C<sub>2</sub>), oxygen (O<sub>2</sub>) and nitrogen (N<sub>2</sub>) as a diluent in the ratio C<sub>2</sub>H<sub>6</sub>:O<sub>2</sub>:N<sub>2</sub> = 10:10:80, into the reactor. The purity of ethane, oxygen, and nitrogen used in this work was 99.7 vol. %, 99.996 vol. %, and 99.999 vol. %, respectively. The gas flow rate was quantified using independent mass flow temperature controllers.

### 2.3.2 Reaction conditions

For a typical experiment, 0.60 g of a heat-treated catalyst with an average particle size of 150  $\mu\text{m}$  was charged to the reactor. Before carrying out the reaction, the composition of the gas mixture was checked using GC, and was preheated to 140 °C. A blank experiment, conducted at 480 °C, confirmed the absence of transformations of both ethane and oxygen in the absence of a catalyst.

The reaction was carried out for 6 hours. In all experiments, the carbon balance was in the range of 100%  $\pm$  2.0%. For systematical study of the effect of temperature and contact time on the catalytic behavior of LaNbMo and VMoTeNb catalysts, the first series of experiments were carried out in accordance with the factorial design of the experiment. The partial pressures of ethane, oxygen, and nitrogen at the inlet were fixed at 7.0, 5.5, and 65.5 kPa, respectively.

## 3. Results and discussion

### 3.1 Texture characteristics of columnar clays

The specific surface of Al-, Al/Zr-columnar clays was determined using indicators of nitrogen adsorption and desorption isotherms by the BET method on a SORBTOMETR-M device (Russia) (table 1).

Table 1 - Textural characteristics of Al-, Al/Zr-columnar clays

Nº	Compound	S <sub>BET</sub> , m <sup>2</sup> /g	V <sub>pore ads</sub> , cm <sup>3</sup> /g	V <sub>pore des</sub> , cm <sup>3</sup> /g	V <sub>micropore,C</sub> , cm <sup>3</sup> /g	Average pore diameter, Å	D <sub>pore ads</sub> , Å	D <sub>pore des</sub> , Å
1	glina MM	53.7097	0.115297	0.119158	0.002722	95.0805	139.1295	117.4108
2	Al-PILCs	173.1012	0.048405	0.061924	0.049691	26.6481	111.0876	51.2044
3	Al/Zr-PILCs	216.3813	0.046253	0.061939	0.063175	24.3099	105.5924	48.1946

Note: V pore ads/des – by method BJH;

Average pore diameter: 4V/A BY BET;

BJH adsorption/desorption average pore diameter: 4V/A.

The textural properties of the synthesized Al-, Al/Zr-columnar clays are shown in table 1. The specific surface of natural clay treated with intercalating agents increased from  $\sim$ 54 m<sup>2</sup>/g to  $\sim$ 215 m<sup>2</sup>/g.

It can be seen from Figure 1 that the specific surface (SBET, m<sup>2</sup>/g) of natural clay grows when it is pillared with intercalating agents of aluminum and zirconium. The average pore diameter of Al-, Al/Zr-columnar clays gradually decreases compared to natural clay. In this case, the average micropore volume (Vm<sub>icropore</sub>, cm<sup>3</sup>/g) in all the studied samples remains unchanged.

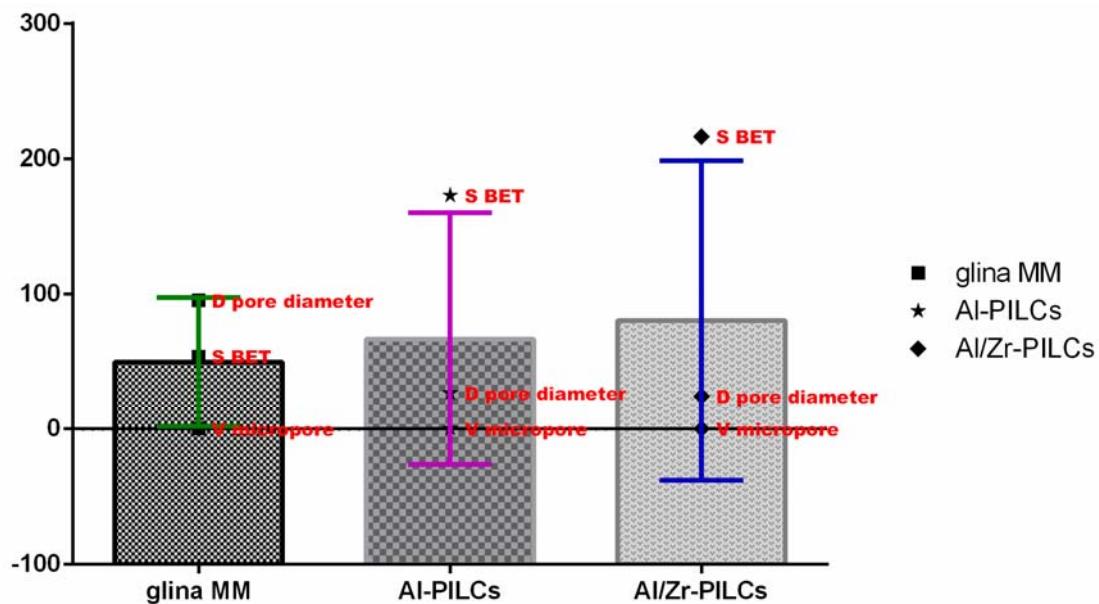

Figure 1 - Comparison of the texture properties of natural clay with Al-, Al / Zr-columnar clays

### 3.2. Catalytic testing

Catalytic properties of the polyoxide LaNbMo and VMoTeNb catalysts applied to Al-, Zr-columnar clays in the oxidative dehydrogenation reaction of ethane (ODE) were studied. The synthesized samples were tested in a flow reactor with on-line chromatographic analysis of the reaction mixture components. The test results are shown in table 2 and in figure 2.

Table 2 - Catalytic properties of polyoxide catalysts LaNbMo and VMoTeNb applied to columnar clays in the oxidative dehydrogenation of ethane

№	Sample	Tp., °C	t, c	X, %	Selectivity, %	
					C <sub>2</sub> H <sub>4</sub>	CO <sub>x</sub>
1	10% LaNbMo/PILCs	400	5,52	10,2	36,1	63,9
		430	5,52	14,6	35,3	64,7
		460	5,52	21,0	35,3	64,7
2	20% LaNbMo/PILCs	400	3,36	0,8	34,1	65,9
		430	3,36	1,5	38,0	62,0
		460	3,36	2,6	44,7	55,3
3	10% VMoTeNb/PILCs	420	5,52	49,3	91,9	8,1
		441	5,52	65,3	87,7	12,3
		461	5,52	79,6	81,3	18,7
4	20%VMoTeNb/PILCs	417	5,52	47,4	90,9	9,1
		440	5,52	62,9	87,6	12,4
		460	5,52	80,6	78,8	21,2

Note: PILCs – Al/Zr-pillared clays

For the initial reaction mixture (vol. %) the components (table 2, figure 2) were taken in the following ratios C<sub>2</sub>H<sub>6</sub>:O<sub>2</sub>:N<sub>2</sub> = 10:10:80.

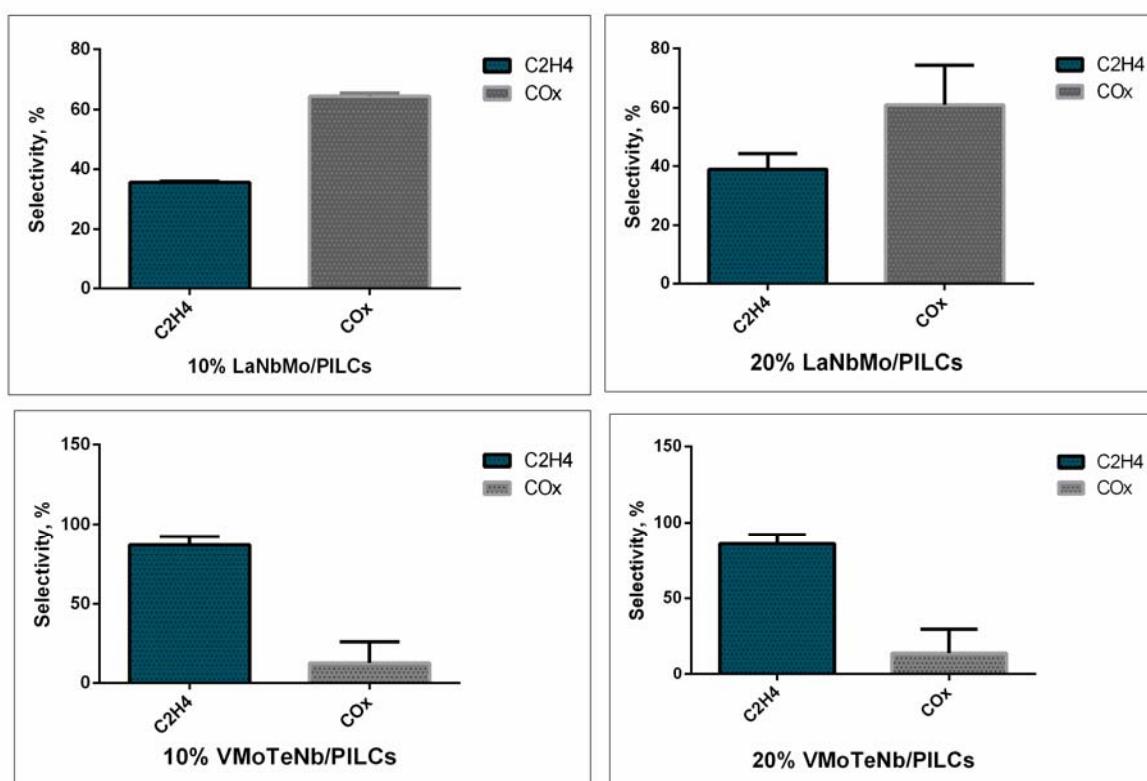

Figure 2 - Oxidative dehydrogenation of ethane to ethylene with LaNbMo and VMoTeNb polyoxide catalysts

The results of catalytic tests of the polyoxide LaNbMo and VMoTeNb catalysts (Figure 2) applied to Al-, Al/Zr-columnar clays showed that catalysts with the chemical composition of VMoTeNb have high selectivity during the oxidative dehydrogenation of ethane to ethylene, despite the active mass in them.

Mixed metal oxides MoVTeNbO have low surface area, which limits their potential industrial use. The inclusion of metal oxides on the substrate improves the mechanical properties of the catalysts and, as a rule, modifies their catalytic behavior, which can adversely affect the catalytic activity [10, 12].

It is known [10, 13] that Mo-containing catalysts applied to natural supports (alumina, modified clays, zeolites) have a higher reactivity than alumina.

**Conclusions.** The results obtained indicate that the deposition of LaNbMo and VMoTeNb polyoxide active phases on Al-, Zr-columnar clays can improve the physical and mechanical properties of these types of catalysts by changing the nature of the crystalline phase, as well as catalytic properties in oxidation reactions

### Al-, Al/Zr-БАҒАНАЛЫҚ САЗБАЛШЫҒЫНА ОТЫРҒЫЗЫЛГАН Мо-ҚҰРАМДЫ КАТАЛИЗАТОРЛАРДЫ ЭТАНДЫ ЭТИЛЕНГЕ ТОТЫҚТЫРА ДЕГИДЛЕУ УДЕРІСІНДЕ СЫНАУ

**Аннотация.** Олефиндер синтезінде бу, сұйық каталитикалық крекингтің және каталитикалық дегидрогенизацияның кеңінен колданылуына қарамастан, алкандарды тотықтыра дегидрлеу (ODH) катализаторларын күрү бойынша қарқынды зерттеулер жүргізілуде. Этанды тотықтыра дегидрлеу (ЭТД)

қатты катализаторда орындалады, онда этан тотықтырышпен, яғни оттегімен әрекеттеседі. Этанды этиленге дейін тотығу арқылы дегидрлендіруді жүзеге асыру үшін жоғары селективті катализатор дайындау басты міндет болып саналады.

Осылайша коспалар құрамы: La:Nb:Mo = 1:0.8:0.2 және V: Mo:Te:Nb = 0.3:1: 0.23:0.12 болатын Al-, Al/Zr-бағаналы сазбалышқтарға отырғызылған LaNbMo және MoVTeNb катализаторы дайындалды. Бағаналы саздың құрылымдық сипаттамасы BET әдісін қолдана отырып, азот адсорбциясы және десорбция изотермаларының көрсеткіші негізінде зерттелді. Синтезделіп алған Al-, Al/Zr-бағаналық сазбалышқтың құрылымдық сипаттамасы табиғи сазбалышқ құрылымынан үстінгі қабытының ~54 м<sup>2</sup>/г-ден 15215 м<sup>2</sup>/г дейін өсуі арқылы ерекшеленеді.

Автоматтандырылған online хроматографиялық анализ орнатылған зертханалық ағынды реакторда каталитикалық тәжірибе жүргізу барысында Al-, Al/Zr-бағаналық сазбалышқ бетіне отырғызылған LaNbMo және VMoTeNb каталитикалық жүйелері этанның тотықтыра дегидрленуіне (ЭТД) қатысты өте жоғары белсенділік пен селективтілік танытты.

Синтезделген катализаторлардың құрылымдық қасиеттері XRD, N<sub>2</sub>, SEM, BET адсорбция әдістері негізінде сипатталды. Ең жоғары белсенділік пен этилен селективтілігін 10% VMoTeNb/PILCs және 20% VMoTeNb/PILCs катализаторлары көрсетті. Этиленнің ең төмен селективтілігін LaNbMo/PILC 10% және LaNbMo/PILCs 20% катализаторлары көрсетті.

Al-, Al/Zr-бағаналы сазбалышқтарға отырғызылған LaNbMo және VMoTeNb катализаторларының каталитикалық сынақ нәтижесін сараптауда химиялық құрамы VMoTeNb катализаторының этиленге тотығу арқылы дегидрлену үдерісінде құрамындағы белсенді массалардың мөлшеріне қарамастан жоғары селективті екендігін көрсетті.

Аралас металл оксидтері MoVTeNb аз көлемді үстінгі бетке ие, бұл олардың өнеркәсіптік қолданылуын шектейді. Металл оксидтерін субстратқа қосу катализатордың механикалық қасиетін жақсартады және, әдетте, каталитикалық белсенділікке теріс есеп етуі мүмкін каталитикалық әрекетті өзгертеді.

Алған нәтижелер Al-, Zr-бағаналы сазбалышқтарға отырғызылған полиоксидтік белсенді фазалы LaNbMo және VMoTeNb катализаторларының тотығу реакциясындағы кристалл фаза мен каталитикалық қасиеттерінің жақсаратындығын көрсетті.

**Түйін сөздер:** тотықтыра дегидрлеу, этан, этилен, механизм, этилен өндірісі.

## **ИСПЫТАНИЕ МО-СОДЕРЖАЩИХ КАТАЛИЗАТОРОВ, НАНЕСЕННЫХ НА Аl-, Аl/Zr-СТОЛБЧАТЫЕ ГЛИНЫ, В ПРОЦЕССЕ ОКИСЛИТЕЛЬНОГО ДЕГИДРИРОВАНИЯ ЭТАНА В ЭТИЛЕН**

**Аннотация.** Несмотря на широкое использование парового крекинга, флюид-катализитического крекинга и катализитического дегидрирование при синтезе олефинов, ведутся интенсивные поиски по разработке катализаторов окислительного дегидрирования (ODH) алканов. ОДЭ этана выполняется на твердом катализаторе, в котором этан реагирует с окислителем, обычно кислородом. Разработка альтернативного способа окислительного дегидрирования этана в этилен является актуальной задачей в присутствии подходящего катализатора.

Таким образом, были приготовлены катализаторы – смешанные оксиды LaNbMo и MoVTeNb с номинальными атомными отношениями La:Nb:Mo=1:0.8:0.2 и V:Mo:Te:Nb=0.3:1:0.23:0.12, нанесенные на Al-, Al/Zr-столбчатые глины. Были изучены текстурные характеристики столбчатых глин по показателям изотерм адсорбции и десорбции азота по методу БЭТ. Результаты данного исследования показали, что текстурные свойства синтезированных Al-, Al/Zr-столбчатых глин отличаются от текстурных свойств природной глины с увеличением их удельной поверхности от ~54 м<sup>2</sup>/г до ~215 м<sup>2</sup>/г.

При проведении катализитических экспериментов на автоматизированном лабораторном проточном реакторе с on-line хроматографическим анализом каталитические системы LaNbMo и VMoTeNb, нанесенные на Al-, Al/Zr-столбчатые глины проявляли более высокую активность и селективность в отношении окислительного дегидрирования этана (ODH).

Детальная характеристика была достигнута с использованием XRD, адсорбции N<sub>2</sub>, SEM, БЭТ для изучения текстурных свойств синтезированных катализаторов. Наибольшую активность и селективность по этилену показали 10% VMoTeNb /PILCs и 20% VMoTeNb /PILCs катализаторы. Наименьшей селективностью по этилену обладали 10% LaNbMo/PILCs и 20% LaNbMo/PILCs катализаторы.

Результаты катализитических испытаний полиоксидных LaNbMo и VMoTeNb катализаторов, нанесенных на Al-, Al/Zr-столбчатые глины, показали, что при окислительном дегидрировании этана в этилен высокую селективность имеют катализаторы с химическим составом VMoTeNb, несмотря на содержание в них активной массы.

Смешанные оксиды металлов MoVTeNb имеют низкую площадь поверхности, что ограничивает их потенциальное промышленное применение. Включение оксидов металлов на подложку улучшает механические свойства катализаторов и, как правило, модифицирует их катализитическое поведение, что может оказывать неблагоприятное влияние на катализическую активность.

Полученные результаты исследования свидетельствуют о том, что нанесение на Al-, Zr-столбчатые глины полиоксидных активных фаз LaNbMo и VMoTeNb может улучшить физические и механические свойства катализаторов этих типов за счет изменения как природы кристаллической фазы и катализитические свойства в реакциях окисления.

**Ключевые слова:** окислительное дегидрирование; этан; этилен; механизм; производства этилена.

## **Publication Ethics and Publication Malpractice in the journals of the National Academy of Sciences of the Republic of Kazakhstan**

For information on Ethics in publishing and Ethical guidelines for journal publication see <http://www.elsevier.com/publishingethics> and <http://www.elsevier.com/journal-authors/ethics>.

Submission of an article to the National Academy of Sciences of the Republic of Kazakhstan implies that the described work has not been published previously (except in the form of an abstract or as part of a published lecture or academic thesis or as an electronic preprint, see <http://www.elsevier.com/postingpolicy>), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyright-holder. In particular, translations into English of papers already published in another language are not accepted.

No other forms of scientific misconduct are allowed, such as plagiarism, falsification, fraudulent data, incorrect interpretation of other works, incorrect citations, etc. The National Academy of Sciences of the Republic of Kazakhstan follows the Code of Conduct of the Committee on Publication Ethics (COPE), and follows the COPE Flowcharts for Resolving Cases of Suspected Misconduct ([http://publicationethics.org/files/u2/New\\_Code.pdf](http://publicationethics.org/files/u2/New_Code.pdf)). To verify originality, your article may be checked by the Cross Check originality detection service <http://www.elsevier.com/editors/plagdetect>.

The authors are obliged to participate in peer review process and be ready to provide corrections, clarifications, retractions and apologies when needed. All authors of a paper should have significantly contributed to the research.

The reviewers should provide objective judgments and should point out relevant published works which are not yet cited. Reviewed articles should be treated confidentially. The reviewers will be chosen in such a way that there is no conflict of interests with respect to the research, the authors and/or the research funders.

The editors have complete responsibility and authority to reject or accept a paper, and they will only accept a paper when reasonably certain. They will preserve anonymity of reviewers and promote publication of corrections, clarifications, retractions and apologies when needed. The acceptance of a paper automatically implies the copyright transfer to the National Academy of Sciences of the Republic of Kazakhstan.

The Editorial Board of the National Academy of Sciences of the Republic of Kazakhstan will monitor and safeguard publishing ethics.
