ALMATY, NAS RK

NAS RK is pleased to announce that News of NAS RK. Series of chemistry and technologies scientific journal has been accepted for indexing in the Emerging Sources Citation Index, a new edition of Web of Science. Content in this index is under consideration by Clarivate Analytics to be accepted in the Science Citation Index Expanded, the Social Sciences Citation Index, and the Arts & Humanities Citation Index. The quality and depth of content Web of Science offers to researchers, authors, publishers, and institutions sets it apart from other research databases. The inclusion of News of NAS RK. Series of chemistry and technologies in the Emerging Sources Citation Index demonstrates our dedication to providing the most relevant and influential content of chemical sciences to our community.

Қазақстан Республикасы Ұлттық ғылым академиясы "ҚР ҰҒА Хабарлары. Химия және технология сериясы" ғылыми журналының Web of Science-тің жаңаланған нұсқасы Emerging Sources Citation Index-те индекстелуге қабылданғанын хабарлайды. Бұл индекстелу барысында Clarivate Analytics компаниясы журналды одан әрі the Science Citation Index Expanded, the Social Sciences Citation Index және the Arts & Humanities Citation Index-ке қабылдау мәселесін қарастыруды. Web of Science зерттеушілер, авторлар, баспашилар мен мекемелерге контент тереңдігі мен сапасын ұсынады. ҚР ҰҒА Хабарлары. Химия және технология сериясы Emerging Sources Citation Index-ке енүі біздің қоғамдастық үшін ең өзекті және беделді химиялық ғылымдар бойынша контентке адалдығымызды білдіреді.

НАН РК сообщает, что научный журнал «Известия НАН РК. Серия химии и технологий» был принят для индексирования в Emerging Sources Citation Index, обновленной версии Web of Science. Содержание в этом индексировании находится в стадии рассмотрения компанией Clarivate Analytics для дальнейшего принятия журнала в the Science Citation Index Expanded, the Social Sciences Citation Index и the Arts & Humanities Citation Index. Web of Science предлагает качество и глубину контента для исследователей, авторов, издателей и учреждений. Включение Известия НАН РК в Emerging Sources Citation Index демонстрирует нашу приверженность к наиболее актуальному и влиятельному контенту по химическим наукам для нашего сообщества.

**BINDING d-ELEMENT OF THE 4TH PERIOD OF V-GROUP
OF THE PERIODIC SYSTEM OF D.I. MENDELEYEV
AND ITS PARAMAGNETIC PROPERTIES**

Abstract. Vanadium is a connecting element between the main subgroup VA and the subgroup VB. In the opinion of B.V. Nekrasov, if we compare the VB group of vanadium elements with the valence states of P and As VA main subgroup, then in the oxidation states of -3, 0, +3 arsenic is an analogue of phosphorus, and in the oxidation state +5, it will not be an analogue of phosphorus. In contrast, in the low oxidation degrees of vanadium, it differs from phosphorus, and in the oxidation state of +5 vanadium is not a complete analogue of phosphorus.

The similarity of the electronic configuration of atoms for vanadium and phosphorus in the +5 oxidation state specifies the similarity of the properties of their chemical compounds.

When comparing vanadium and its compounds with elements of the VA subgroup, we conclude that vanadium is a binding element between the VA subgroup and the VB subgroup and the compounds have similar properties.

As a result of many years of work, it was found that vanadium in the penta- and tetravalent states has paramagnetic properties. In crude oil, it is in a tetravalent state.

In order to improve the standard photocalorimetric method for determining vanadium in oil and petroleum ashes, a more rapid method was proposed for estimating the total concentration of vanadium based on the interaction of V_2O_5 with concentrated hydrochloric acid.

Studies of the EPR spectra of porphyrin complexes with transition metals such as copper were of great importance in the identification of natural porphyrin complexes.

In the course of comparison of experimental works of paramagnetic properties of vanadium and phosphorus with each other, it can be said that their application is of great practical importance in different fields of science.

Summing up the results of studying the reduction of triphenylphosphine with an alkali metal, we proposed a scheme for the splitting of triphenylphosphine, including the formation of radical anions.

Keywords: binding d-element, vanadium, incomplete analogue, electronic structure, paramagnetism.

Vanadium is a connecting element between the main subgroup VA and the subgroup VB. It is the first d-element of the VB subgroup, its analogues are niobium and tantalum. Their electronic structure and valence states are equal. The VB element group resembles the IVB group of elements. In normal conditions, vanadium in the cold dissolves in "aqua regia" and when heated in nitric and concentrated sulfuric acids. Upon fusion with alkalis, anionic oxo complexes are formed. The oxidation degree of niobium and tantalum in the form of a halide is +4 [1-3]. Vanadium in the form of vanadyl - VO^{2+} ion enters into many chemical reactions and is found in complex compounds [4].

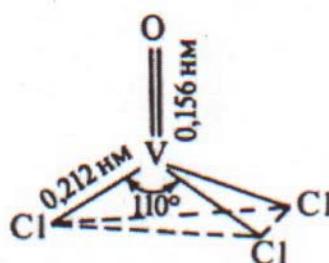

In the opinion of B.V. Nekrasov [5], if we compare the VB group of vanadium elements with the valence states of P and As VA main subgroup, then in the oxidation states of -3, 0, +3 arsenic is an analogue of phosphorus, and in the oxidation state +5, it will not be an analogue of phosphorus. In contrast, in the low oxidation degrees of vanadium, it differs from phosphorus, and in the oxidation state of +5 vanadium is not a complete analogue of phosphorus (Table 1).

The 3d orbital of the phosphorus atom makes phosphorus chemistry deeply different from the nitrogen properties. The similarity of the electronic configuration of atoms for vanadium and phosphorus in the +5 oxidation state specifies the similarity of the properties of their chemical compounds.

Table 1 - Comparison of the valence states of vanadium, phosphorus, and arsenic

Valence	Electron arrangement by energy levels in atoms of elements		
	V (VB)	P (VA)	As (VA)
-3	-	2,8,8	2,8,18,8
0	2,8,11,2	2,8,5	2,8,18,5
+3	2,8,10	2,8,2	2,8,18,2
+5	2,8,8	2,8	2,8,18

Vanadium (V) oxychloride - a liquid (mp. -77°C , bp. 127°C). VOCl_3 has the form of a distorted tetrahedron with a vanadium atom in the center [2].

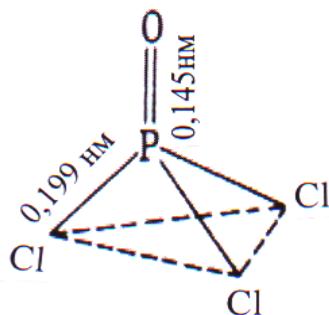

Vanadium (V) halogenide reacts with the main halogenide to form an anionic complex:

Phosphorus oxotrichloride (V) - a liquid (mp 1°C , bp 107°C) formed by heating the mixture of P_2O_5 and PCl_5 :

POCl_3 has the form of the distorted tetrahedron [2] (see Fig.). In non-aqueous solutions, PF_5 interacts with basic fluoride:

The coordination number in the vanadium (V) and phosphorus (V) complex compounds is 6. For the compounds under consideration, in which these elements are in the valence state 5, the chemical properties are similar.

When comparing vanadium and its compounds with elements of the VA subgroup, we conclude that vanadium is a binding element between the VA subgroup and the VB subgroup and the compounds have similar properties.

It is known that vanadium (V) oxide in an acidic environment exhibits oxidizing properties:

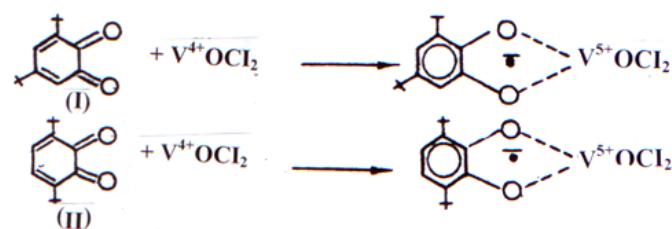

At present, in many research laboratories, the methods of neutron activation analysis (NAA) and X-ray fluorescence analysis (XRF) are used to determine vanadium and other trace elements in oils and petroleum products. The use of neutron activation analysis for these purposes is associated with several known technological difficulties. The main drawback of X-ray fluorescence analysis is the superimposition of the titanium spectral line on the vanadium spectral line in the X-ray fluorescence spectra.

Due to the existing shortcomings of these methods in the geological calculation of vanadium reserves and mass laboratory analyzes, GOST 10364-63 is used to determine the content of vanadium in oils and petroleum products, the essence of which is the photometry of the phosphoric-tungsten-vanadium complex formed after cineration of the test sample of the oil and petroleum product as well as after the processing of the ash by hydrochloric and phosphoric acids and sodium tungstate. However, the photocolorimetric method does not always have the necessary sensitivity and selectivity. Also, one analysis takes a lot of time, and analytically requires many operations.

To improve the common photocolorimetric method for determining vanadium in petroleum ashes, a more rapid method is proposed for estimating the total amount of vanadium in petroleum ashes based on the interaction of V_2O_5 with concentrated hydrochloric acid. The vanadium concentration in the studied petroleum ashes of the Caspian Sea region was determined by the anisotropic electron paramagnetic resonance (EPR) spectrum of the resulting vanadyl chloride [6]. The advantages of the EPR method for determining total vanadium in petroleum ash are its performance, selectivity, high accuracy, and reliability compared to traditionally used photocolorimetric methods.

In this work, we propose the EPR method for estimating the total vanadium concentration in petroleum ashes based on the ability of vanadium d-elements to form stable paramagnetic complexes with sterically hindered quinones [7]. This was facilitated by the forming complexes of o-semiquinones with metal chlorides of group III [8].

In this regard, we attempted to study the interaction of vanadyl chloride with 3,5-di-tert-butylorthobenzoquinone and 3,6-di-tert-butyl-orthobenzoquinone in toluene. This type of redox process reduces to the oxidation of V^{4+} to V^{5+} with the formation of a vanadium-containing complex with a paramagnetic o-benzosemiquinone ligand [7]:

where $\text{---} = C(CH_3)_3$

The analysis of the vanadium content in oil and petroleum products plays a significant role in oil refining and identifying promising deposits for the extraction of valuable metal.

In the natural porphyrin complexes identification, studies of the EPR spectra of porphyrin complexes with transition metals such as copper were of great importance [9]. If we compare the EPR spectrum of the VO – EP complex (figure 1a) and the Cu^{2+} – EP obtained from it, we receive very interesting data.

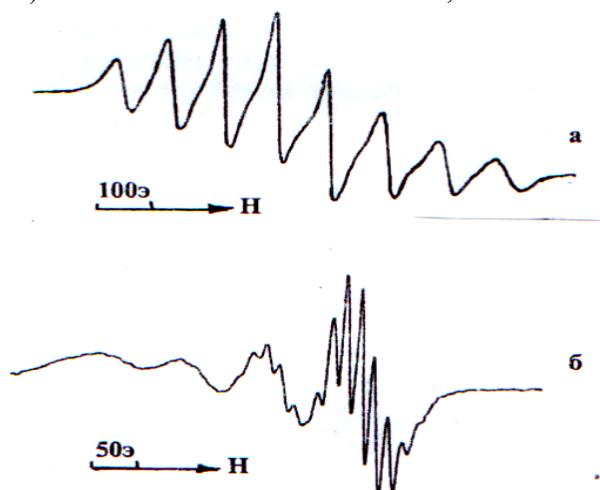

Figure 1 - EPR spectrum of the VO - EP (a) complex from the Karazhanbas oil and obtained Cu^{2+} - EP (b)

Cu^{2+} - EP has a square - planar structure in which a copper ion lies in the plane of four equivalent nitrogen atoms of the porphyrin ligand (Fig. 1b). The isotropic spectrum of this complex, recorded in solution, consists of four hyperfine structure (HFS) lines due to the interaction of an unpaired copper electron with a $^{63,65}\text{Cu}$ nucleus; HFS constant is $a_{\text{Cu}}=102.5 \text{ Gs}$ with $g_{\text{H3O}}=2.101$.

An additional hyperfine structure is observed near the band in a strong field due to the interaction of an unpaired electron with ligand nitrogen nuclei. The line intensity of the additional HFS is expressed by the ratio 1:4:10:16:19:16:10:4:1. Nine lines of the hyperfine structure with splitting between the lines $a_N = 12.5 \text{ Gs}$ are due to the interaction of the unpaired electron with the magnetic moments of four united nitrogen atoms ($I_N=1$) of the porphyrin macrocycle. Thus, the homologues of all VOP VO^{2+} extracted from oils coordinate with the four nitrogen atoms of the pyrrole nuclei.

Summing up the study of the recovery of triphenylphosphine with an alkali metal, Brit and Kaiser [10] proposed a triphenylphosphine splitting scheme that does not include the formation of an anion radical (AR).

When reducing triphenylphosphine with alkali metals (K and Na) in 1,2-dimethoxyethane (DME) and tetrahydrofuran (THF) at -70°C with EPR method, we found almost the same EPR spectrum [11] as Ilyasov [12] during electrochemical recovery. In DME, the spectrum is described by the following hyperfine structure constants:

$$a_p = a_h^{\text{para}} = 2.5 \text{ Gc}, a_h^{\text{ortho}} = 1.25 \text{ Gs}$$

The analysis of the spectrum hyperfine structure shows that an unpaired electron is regularly delocalized throughout the molecule. Figure 2 shows the quantum numbers under the spectrum corresponding to the projections of the resultant spin of 3 pairs of protons ($I_H=1/2$) and one phosphorus nucleus ($I_P=1/2$). As follows from the experimental data, the triphenylphosphine reaction network in the interaction with alkali metals should include the stage of single electron transfer from the metal and the formation of the primary triphenylphosphine anion radical

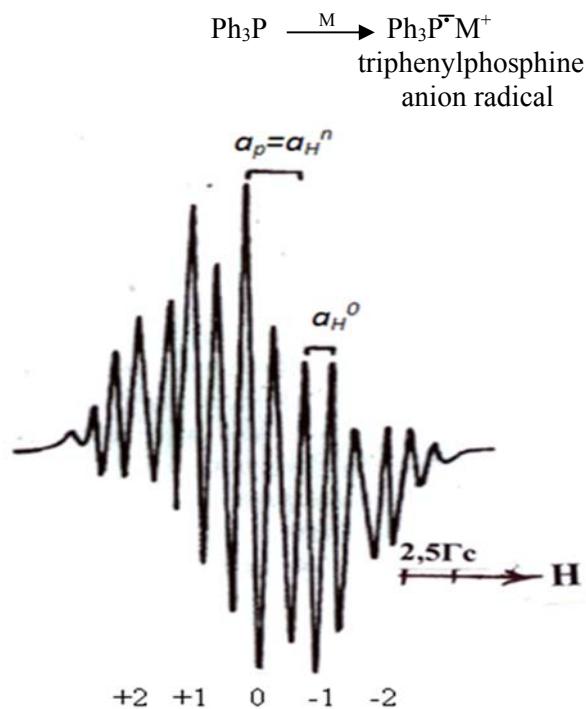

Figure 2 - EPR spectrum of triphenylphosphine-potassium anion radical in DME at -60°C

Therefore, during the organic elements chemistry course [13–15] for students of chemical specialties in universities, it should be noted that upon the preparation of organic alkali metal derivatives from triphenylphosphine, the very first-stage triphenylphosphine anion radical is formed.

In recent years, the intensive development of the homolytic chemistry of phosphorus has aroused interest in the phosphorus centric and, in particular, phosphonyl radicals [16,17].

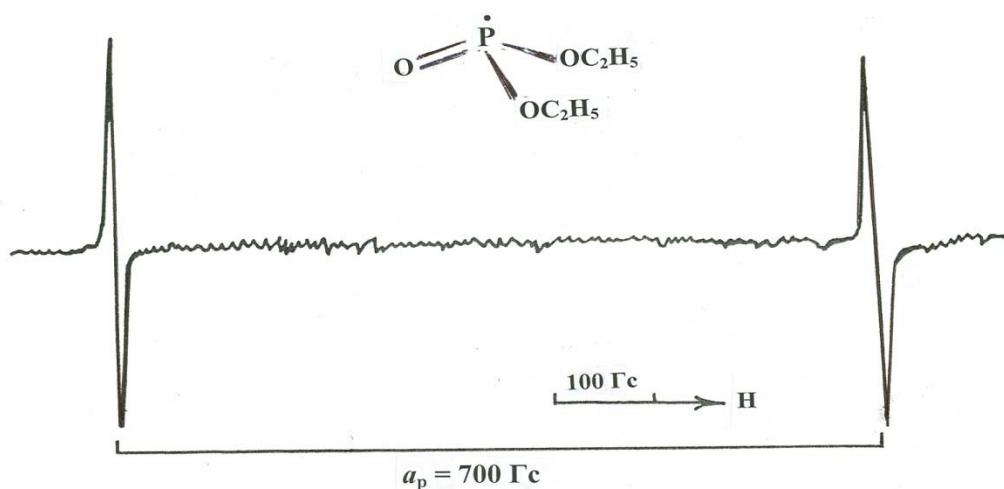

Figure 3 - EPR spectrum of phosphonyl radicals

Phosphonyl radicals (figure 3) are easily formed during the photolysis of the corresponding hydrophosphoryl compounds into di-tert-butyl peroxides.

In this case, the unpaired electron is delocalized mainly in the phosphorus atom. The same spin as the proton, i.e., $\frac{1}{2}$, is possessed by ^{31}P nuclei that are part of various phosphonyl compounds. The hyperfine interaction of the unpaired electron with this magnetic core in radicals leads to doublet splitting in the EPR spectrum as in the case with a proton.

Experimental part. The triphenylphosphine anion radical was received in DME by the common method on metal mirrors of K and Na at -70°C in a vacuum. The EPR spectrum was recorded with a Varian E-12 spectrometer.

Using the methods of demetallization and chromatographic separation, etioporphyrin was obtained from vanadyl porphyrin concentrates of the Karazhanbass oil. Bivalent copper complexes were prepared by reacting of the anhydrous salt $CuCl_2$ with etioporphyrin in dry chloroform at room temperature.

²С. Өтебаев атындағы мұнай және газ университеті

Д.И. МЕНДЕЛЕЕВТІҢ ПЕРИОДТЫҚ ЖҮЙЕСІНІҢ 4-ПЕРИОДЫ В ТОБЫНЫң БАЙЛАНЫСТЫРУШЫ Д-ЭЛЕМЕНТІ ЖӘНЕ ОНЫҢ ПАРАМАГНИТТІК ҚАСИЕТТЕРИ

Аннотация. Ванадий VA негізгі тобы мен VB кіші тобы арасындағы байланыстыруышы элемент ретінде әрекет етеді.

Б.В. Некрасовтың ұсынысына сәйкес, егер ванадий элементі VB тобын негізгі топтың Р және As VA валентті күйімен салыстырсақ, онда тотығу дәрежесінде -3, 0, +3 құшала фосфордың аналогы болып саналады, ал тотығу дәрежесі +5 болса, құшала фосфордың аналогы болмайды. Керісінше, ванадий тотығуының тәменгі дәрежесінде фосфордан ерекшеленеді, ал тотығу дәрежесі + 5 ванадий фосфордың толық емес аналогы болып есептеледі.

Ванадий мен фосфор атомдарының электрондық конфигурациясының тотығу дәрежесі +5 болуы олардың химиялық қосылыстары үқсастық қасиеттерін тудырады.

Ванадий мен оның қосылыстарын VA негізгі топ элементтерімен салыстыру барысында біз ванадий – VA кіші топшасы мен VB негізгі топшасы арасындағы байланыстыруушы элемент, ал қосылыстары үқсас қасиеттерге ие деген корытындыға келдік.

Көпжылдық жұмыстың нәтижесінде ванадий бес және төрт валентті күйінде парамагнетизм қасиетінің бар екендігі анықталды. Шикі мұнайда ол төрт валентті күйде болады.

Мұнай және мұнай өнімдері күлдеріндегі ванадийді анықтаудың стандартты фотокалориметрлік әдісін жетілдіру мақсатында жұмыста ванадийдің жалпы мөлшерін бағалау үшін ванадийдің бес валентті оксидін (V_2O_5) концентрлі тұз қышқылымен өзара әрекеттестіруге негізделген неғұрлым жылдам анықтау әдістемесі ұсынылған.

Табиғи текті порфирин кешендерін сәйкестендіруде мыс сияқты өтпелі металдармен порфирин кешендерінің ЭПР спектрлерін зерттеу үлкен маңызға ие болды.

Ванадий мен фосфордың параметрлерін бір-бірімен салыстыра отырып, оларды ғылымның түрлі салаларында колдану зор практикалық маңызға ие деп айтуда болады.

Трифенилфосфиннің сілтілі металмен тотықсыздандынын зерттеу нәтижесінде анион радикалдар түзетін трифенилфосфиннің ыдырау схемасын ұсындык.

Түйін сөздер: байланыстыруши d-элемент, ванадий, толық емес аналоги, электрондық құрылышы, параметрлер.

СВЯЗУЮЩИЙ d-ЭЛЕМЕНТ 4-ГО ПЕРИОДА V- ГРУППЫ ПЕРИОДИЧЕСКОЙ СИСТЕМЫ Д.И.МЕНДЕЛЕЕВА И ЕГО ПАРАМАГНИТНЫЕ СВОЙСТВА

Аннотация. Ванадий выступает как бы связующим элементом между главной подгруппой VA и подгруппой VB.

Согласно представлениям Б.В.Некрасова, если сопоставить VB группу элементов ванадия с валентными состояниями P и As VA главной подгруппы, то в степенях окисления -3, 0, +3 мышьяк является аналогом фосфора, а в степени окисления +5 мышьяк не будет аналогом фосфора. Напротив, в низких степенях окисления ванадий отличается от фосфора, а в степени окисления +5 ванадий является *не полным аналогом* фосфора.

Аналогичность электронной конфигурации атомов для ванадия и фосфора в степени окисления +5 обусловливает сходства свойств их химических соединений.

В ходе сравнения ванадия и его соединений с элементами VA подгруппы мы пришли к выводу, что ванадий- связующий элемент между подгруппой VA и подгруппой VB, а соединения обладают аналогичными свойствами.

В результате многолетней работы было установлено, что ванадий в пяти и четырехвалентном состоянии обладает параметризмом. В сырой нефти он находится в четырехвалентном состоянии.

С целью усовершенствования стандартного фотокалориметрического метода определения ванадия в золях нефтей и нефтепродуктах в работе предложена более экспрессная методика для оценки общего количества ванадия, основанная на взаимодействии V_2O_5 с концентрированной соляной кислотой.

В идентификации порфириновых комплексов природного происхождения большое значение имели исследования спектров ЭПР комплексов порфиринов с такими переходными металлами, как медь.

В ходе сравнения экспериментальных работ параметрических свойств ванадия и фосфора друг с другом, можно сказать, что их применение имеет большое практическое значение в разных областях науки.

Подводя итоги изучения восстановления трифенилфосфина щелочным металлом, мы предложили схему расщепления трифенилфосфина, включающую образование анион радикалов.

Ключевые слова: связующий d-элемент, ванадий, неполный аналог, электронная структура, параметризм.

Publication Ethics and Publication Malpractice in the journals of the National Academy of Sciences of the Republic of Kazakhstan

For information on Ethics in publishing and Ethical guidelines for journal publication see <http://www.elsevier.com/publishingethics> and <http://www.elsevier.com/journal-authors/ethics>.

Submission of an article to the National Academy of Sciences of the Republic of Kazakhstan implies that the described work has not been published previously (except in the form of an abstract or as part of a published lecture or academic thesis or as an electronic preprint, see <http://www.elsevier.com/postingpolicy>), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyright-holder. In particular, translations into English of papers already published in another language are not accepted.

No other forms of scientific misconduct are allowed, such as plagiarism, falsification, fraudulent data, incorrect interpretation of other works, incorrect citations, etc. The National Academy of Sciences of the Republic of Kazakhstan follows the Code of Conduct of the Committee on Publication Ethics (COPE), and follows the COPE Flowcharts for Resolving Cases of Suspected Misconduct (http://publicationethics.org/files/u2/New_Code.pdf). To verify originality, your article may be checked by the Cross Check originality detection service <http://www.elsevier.com/editors/plagdetect>.

The authors are obliged to participate in peer review process and be ready to provide corrections, clarifications, retractions and apologies when needed. All authors of a paper should have significantly contributed to the research.

The reviewers should provide objective judgments and should point out relevant published works which are not yet cited. Reviewed articles should be treated confidentially. The reviewers will be chosen in such a way that there is no conflict of interests with respect to the research, the authors and/or the research funders.

The editors have complete responsibility and authority to reject or accept a paper, and they will only accept a paper when reasonably certain. They will preserve anonymity of reviewers and promote publication of corrections, clarifications, retractions and apologies when needed. The acceptance of a paper automatically implies the copyright transfer to the National Academy of Sciences of the Republic of Kazakhstan.

The Editorial Board of the National Academy of Sciences of the Republic of Kazakhstan will monitor and safeguard publishing ethics.
